

pnØva.com — 2026 build

Rev **2026.08.02**. Four builds — two variants x two URL styles:

Folder	URLs	
with-store/	/drops.html	Flat. Double-click previewable.
with-store-clean/	/drops	Folder-per-page. Must be served. Upload this one.
no-store/	/drops.html	Same, store removed everywhere
no-store-clean/	/drops	Same, store removed everywhere

Which one goes on the server

***-clean.** Each page becomes its own folder with an `index.html` inside, so `pnØva.com/drops` serves `drops/index.html`. That means pages sit one level deep, so every asset path is **root-relative** (`/style.css`, `/images/...`) — which is exactly why opening one by double-clicking shows an unstyled page: `/style.css` resolves to your drive root. Use the flat build for that.

A `.htaccess` ships with each clean build. It strips trailing slashes, maps bare paths to their `index.html`, and 301s every old URL — including `geocache.html` → `/drops`, since that page was renamed, not just re-pathed.

Both are generated by `build.py` from one source, so they cannot drift apart. **Edit the build script, not the output folders** — re-running wipes and regenerates both.

`python build.py`

It needs two things, and finds both on its own:

	Where
The 2026-07-06 build it derives from	<code>_source/website-fixed/</code> (bundled here)
The brand kit	<code>Desktop\PNØVA</code> — the sibling folder

Change anything in `PNØVA` and re-run; both variants pick it up. The source is bundled rather than referenced so this folder stays self-contained and the script keeps working years from now.

What changed from the 2026-07-06 build

Branding - Corrected logotype — katakana now `ピー・ノバ` everywhere, including the raster art. `logo.svg` is outlined so it needs no font installed; the sprite atlas driving the animated homepage logo had its `—バ—` cell repainted to `バ` (the glyph cut from the original art, so the font still matches); and `logo2.png` / `logo.png` were regenerated from the corrected vector. - **The no-JS fallback logo is now visible.** `logo2.png` was 100% black, displayed on the black homepage with no filter — so with JavaScript off the homepage showed nothing at all. It is now red. - Palette migrated to the brand kit. Body copy came **off pure white onto linen** `#E8E2DC`, which is what lets bone `#FFFFFF` mean *you are here*. Yellow is gone entirely — state went to bone, the `h3` sub-headings went to the chroma. Greys warmed to taupe/ash. - Fixed the two drifted reds (`#ff1608`, `rgba(255,22,8,.5)`).

Structure - `geocache.html` → `drops.html`, and ~550 lines of dead `geo-*` CSS stripped out. Nav and home menu rewritten on every page.

No more CDNs. The site now makes **zero external requests**: - Press Start 2P is self-hosted from `fonts/` — which also removes the `@import-ordering` trap that once stopped the pixel font loading at all. - CreateJS is vendored to `vendor/` — `index.html` already carried fallback code for that CDN failing, which tells you it had.

The store was rebuilt, not recovered

shop.html did not survive. (It is `store.html` now — renamed 2026-08-02.) It isn't in `website-fixed.zip`, `website-clean-urls.zip`, files `(2).zip`, or anywhere on the Desktop. Your `PROJECT-HISTORY.md` explains why: the dev container reset partway through that session, the site was restored from the packaged zips, and the shop was layered back on afterwards — so it only ever existed in a container that no longer exists.

What ships here is rebuilt from the description in that history, and matches it:

- Card grid, auto-fill minmax(280px, 1fr); 4:3 image, name, glowing price, unlimited-length description, ADD TO CART pinned to the card bottom
- Floating CART button with a count badge that pulses on add
- Slide-in panel: qty +/-, remove, subtotal; closes on Esc or backdrop
- Persisted in localStorage under **pnova-cart** (same key as the original)
- Items are pure HTML with data-id / data-name / data-price
- SQUARE INTEGRATION POINT comment marks where checkout() gets replaced; the cart is exposed as cartLines() and total()

Product copy and images are placeholders. **The three data-ids are made up** — if the original shop ever resurfaces, reconcile the ids before going live or returning customers' saved carts will mismatch.

Before deploying

1. Replace the placeholder art in images/shop/, images/blog/, images/about/, and the two drop placeholders in images/.
2. Wire up Square — see **STORE-SETUP.md**, which covers the three checkout modes, a working serverless endpoint, and what else you need before listing anything for real.
3. Regenerate the clean-URL build (build-clean.py from the old repo) and add /drops to .htaccess, with a 301 from geocache.html → /drops.
4. **Fix the stale line in the site's own CLAUDE.md** — it still opens with "a Final Fantasy VII-inspired theme", which reduces the whole influence set to one game's window chrome.

Local preview

```
python -m http.server 8940 --directory with-shop
```

Both variants are also registered in .claude/launch.json as site-shop (8940) and site-noshop (8941).

Verified

Zero external requests · all six pages parse clean · no yellow anywhere · prose at 16.3:1 on black · nav single-line at 360px · drops map tiles and labels both rendering · cart add/decrement/remove/persist/Esc all working · no console errors on any page.
